

Step 1: Load the CSV into SQLite and Create the Table

```
import sqlite3
import pandas as pd

# Load the dataset
csv_file = '/mnt/data/SuperStore_Sales_Dataset.csv'
df = pd.read_csv(csv_file)

# View column names to decide what to use
print(df.columns)
```

Step 2: Save to SQLite and Query Sales Summary

```
# Connect to SQLite and write to sales_data.db
conn = sqlite3.connect('sales_data.db')

# Save DataFrame to a table named 'sales'
df.to_sql('sales', conn, if_exists='replace', index=False)

# Run SQL: group by product and summarize quantity and revenue
query = """
SELECT
    [Product Name] AS product,
    SUM(Quantity) AS total_qty,
    SUM(Sales) AS revenue
FROM sales
GROUP BY [Product Name]
ORDER BY revenue DESC
LIMIT 10
"""
```

```
summary_df = pd.read_sql_query(query, conn)
conn.close()
```

```
# Print the result
print("Top 10 Products by Revenue:")
print(summary_df)
```

Step 3: Plot the Sales Data

```
import matplotlib.pyplot as plt
```

```
# Bar chart of revenue by product
plt.figure(figsize=(10, 6))
summary_df.plot(kind='bar', x='product', y='revenue', legend=False, color='green')
plt.title('Top 10 Products by Revenue')
plt.xlabel('Product')
plt.ylabel('Revenue ($)')
plt.xticks(rotation=45, ha='right')
plt.tight_layout()
plt.savefig('sales_chart.png')
plt.show()
```
